    →「本人が1008指に通りに発声していると判断できるときのみ受理判定をする」というのは無望り

→ 数学到の中で 井や 以上同じだと参段では安照率が高く会り、現立できた。
    →「本人が4個の数字中3個以上、指で通りに第百していると判断できるときの多受理判定をする」ことは

rA rR
                                                                                                                                                                                          ランダムな数字列は棄却または保留にし(受理しない)、誤った判定をしないことができることを示す。
結果として、数字を10個(または数字5個を2回入力)入力して判定すれば実現できる。が、。。
解釈:t=10で、偽陽性と偽陰性が0を違成できる。ただし、若干数の保留があり、非指定数字列が
ランダム数字列の場合である。
                                                                                                                                                                                                                                                                       →「テキスト指定形ではテキストを正しく発声したと判断できるときのみ受理判定をする」ことと
                                                                                                                                                                                                                                                          「本人が5個の数字中 4個以上、指定通りに発声していると判断できるときのみ受理
                                                                                                                                                                                                                                                                                    と矛盾する?しない?

                                                                                                                                                                                                                                                     約80%=1-exp(-1.6)=0.798 を学習し、
                                                                                                                                                                                              2. 評価実験を行う前に、まず、話者 CAN2,数字 CAN2,話者数字 CAN2の分類性能を上げる。
パギング学習で、alpha=1.6のとき、与えられたデータの内、約80%=1-exp(-1.6)=0.798 を学習し
投りを予報することとなり、予測性能が長くなる可能性がある。
(なお、alphaを大きくすると来知ず一タに対する汎化能力の見報1のバラツキが大きくなるので、
通常は、alpha=0.7として50%学習し、幾り50%を予測するものを使っている。今回は汎化能力の見。

重ならない。受理のしきい。他はpae0.4、棄却のしきい。他paeの主要が可能を定すれば良い。
こ数字照合では第3ステップから、受理すべき事後確率と棄却すべき事後確率の958誤差範囲が重ならない。受理のしきい。値はpae0.69 薬却のしきい値pae0.46程度とすれば良い。
3.数字の今までをランダムに発声すると1.11の割骨で「正解、あるいは。900 確率で不正解に
3.数字の今まできるので最後のzico、90例はその場合を示す。話者照合では受理となるが、数字照合で変更なできるので、結果として棄却とする。判定数字数は3以上であれば良い。実用的でもある。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   publor 'test_s_ric0_Oytm1_0.9.dat" using 1:2 w l, "" using 1:2:3 w errorbars,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 3.3.2.4.7.1 法指定語者と指定数字列の場合(rico_0)のみ受理され、受理と棄却は第2数字目からしきい値でかけることができることを示す。
てかけることができることを元年。
(2) (3)と(4)はそれぞれテキスト依存とはテキスト独立の語者照合を表し、テキスト依存は
第1数字からしきい値による受理と棄却が可能であるが、テキスト独立は第2数字から可能となる。
(3)話者数字のたる。 (4)話者のANSと数字のANSと数字のANSと数字のANSと数:
・ 直着は学習に時間がかかるが、後者は学習が多なくて済む。
・ 前者は、棄却のとき話者が不正解か数字列が不正解か分からないが、後者は分かる。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ヨンでは、p-{FP}とp_{FV}の分散は、FPとFNの各データに対する分散として求めた!

                                                                                               gnuplot
```

現プログラムでは使えない。また、次のオプションも可能。 cmethod>=1, cytha>=0: ymeanN[m]からymeanP[m]までをcnyth>等分してythの値とし、p_{FN}とp_{FP}の 分散が小さくなるyth を使用。しかし、 cytha>=0.9とした上の方法の方が良かったので以下では検討

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ir5.24e-01<PIrth<minPIv8.74e-01   2012.02.14 (1) ギブス分布を使う話者識別プログラム(1004gibbs-sr.c)を作成し,単純ペイズを使う話者識別プログラム (loo4bayes-sr.c) 13519 も同 13517

###############

98:0.96 13516

(2) text-indepdata.datに対し,loo4gipbs-sr でvoid:2を使って,mex:-1で識別率100%,mex:4で1個間違いとで text-indepdata.datに対し,loo4bayes-srではvoid:0,1,2 のいづれも,mex:-1で識別率100%,mex:4でこれ 良い識別率を達成するパラメタは見つかっていない(見つかるかもしれないが…).

Dec 05 2019 13:52:41 readmecan2mspeech.txt

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             13631                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1dfftsmooth                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14071                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  #checklorenz#./can2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        #checklorenz#${k} 0
