上野オラく test->MSEC 仮に入れて、abisort.xbで MSEmspをソートしているけれど、WSEmeanでソートできるようにしてくれませんか?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (1) 黒木です。INCXNO4 の問題で多段予測を指定した時点からの1区間だけでなく、20(sim.cの4define NT 20 で設定)時点後の区間まで1時点ずつずらして行い、そのNSEの平均をgivendata->zljcmn04data->MSEMeanにしまうようにしました。

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MSDを求め平均したものが MSDmeanです。
下は、以前のように一区間のみでパラメタを設適化しても、そのとなりの区間
てはさまく予測できない現象が顕細できたからです。ODJLOckの最適化を行った
結果、FB1Sはかなり大きな値 548になったがうまくいくようである。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           例えば、ruby ./gtest.rb 930 0 0 をすると他のプロックの与えられたデータとこの区間の929までのデータを学習し、その学習結果を使って、980.949 930.949
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           http://terasu.cntl.kyutech.ac.jp/~kuro/sotu/2004/ueno/can2b040225.tgz

* 先生に言われたメモリリークを起こすバグですが、発見しましたので

* パグフィックスして更新しました。ダウンロードして試してみて下さい。

* いつものように更新削のファイルは*.origという拡張子をうっています。

* wget -v http://terasu.cntl.kyutech.ac.jp/~ueno/study/can2b04021lueno.tgz

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          can2online
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  100

    sigma2hatの計算が間違っていたので訂正した。
    直視化エントロビーnentropyの計算をして、再初期化のための関値とした。nentropy=0.95が良いようだ。
    ⇒まず再初期化により歪を均一化し、次に勾配法で微調整するという具合になる。

                                                                                                                                                                                                                                                                                                                                                                                                                  #0:timeseries,1:chaos prepare_data() in my_function.c
                                                                                                                                                                                                                                     ニット数により 再初期化の基準を変える nentropy_thresh を導入した。

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      n_train);を繰り返す。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            030716e
(1)時音の解像度は1/15であり、かつ有効数字6桁まで(例えば0.066667≈1/15)
のようだ。これに対応できるようにcalc_output()で特殊処理した。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (1) lorenz やO7train は学習回数が小さく、widthが小さい方が良いみたい?(2) カオス時系列を発生させるRungeKutta法との検討を行った。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (1)解像をより一般化した。
(1)解像をなより一般化した。
(2)正規化を導入:正規化した信号で学習と予測を行い、元にもどして誤浴を
測るようにした。
元の信号はgivendata->x[t],givendata->x[t],
処理信号はgivendata->x[t],givendata->x[t],
(2) に、calc_output()も変更。
(3) 従来のpred は msp(多段予測)、従来のtest はssp(一段予測)の観点から
サブルーチンと今変数化などを変更した(結構大幅な変更)。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (2) in seco_msp_test()でデータの解像度が正整数などのとき、予測値は実数
顕光はその解像度で解価するようにした。
そのため calc_output()に第3引数を追加し
NET *net, FLOAT *x, FLOAT *y)とした。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       train->x, n_train);は2つのルーチンで構成
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (1) Santafe data (A.datA.cont)のためcalc_output()で整数型を導入
exec_simの人力が1つ増えた。

                                                                                                                                                   また, //test_online.sh でオンライン学習での時系列予測を行いますが,
こちらの方はあまりソースをいじっておらず,
まだ未完成ですのでご了承ください.
                                                                                                                   各パラメータは、/test_batch.sh で調整するようになっているのでそちらを変更してください.
予測する時系列は今のところ,Mackey-Glassにしか対応していません.
ソース自体もまだまだやっつけ仕事で書いてますので読みにくいと思いますが,よろしくお願いたします.
