                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19524                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            19625 GSLの方が良いことがある。以下の3手法を導入
make clean; make "GSL=1" #jacobi法 遅いが構度がよいはず
make clean; make "GSL=2" #従来法 中程度、戻ってこないことがある
make clean; make "GSL=3" #mod法 遅い、戻ってこないことがある
でコンパイル。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (1) can 2 のコマンドに mspj (LJCNNV04の予測結果出力)を追加。
(2) LJCNNV04モトドのときはデータファイルではなく
data.txt, data.dat, smooth.dat, smooth..dat があること
があるバスを指定すること。
(3) dt[] (wy_function.c)の計算間違いを修正。MSEG1はゼロになることがあ
るので sim.os を修正。
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (1) IJCXXXV04モードのとき連続した10組の多段予測テストを行うようにした。
(2) IJCXXXV04モードでの入力をfromのみにした(下のt_t2は読まず、
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    無木先生・程に言われたメモリリークを起こすバグですが、発見しましたので
、バグフ・ケックスして更新しました。ダウンロードして試してみて下さい。・いつものように更新前のファイルは*.oxigという拡張子をうっています。

    sigma2hatの計算が間違っていたので訂正した。
    in 規札エントロビーnentropyの計算をして、再初期化のための閾値とした。
nentropy=0、95% 良いようだ。
→まず再初期化により歪を均一化し、次に勾配法で微調整するという具合になる。

                                                                                                                                                                                                                                                                                                                                                                               #0:timeseries,1:chaos prepare_data() in my_function.c

(1) GSL(正確な最小2乗解法)によるmodify_M_batch のルーチンの誤りを訂正し、実験した。 コンパイル方法は 040119 f03 50sspl.7329e-06>9sspl.3566e-06(1.3728e-04)N500k2w0.1vm3:0040119 f11 50ssp3.7047e-06>32ssp3.5536e-06(4.3379e-05)N500k2w0.1vm3:0040119 f17 50ssp6.1905e-06>50ssp6.1905e-06(5.0621e-05)N500k2w0.1vm3:0040119 f07 50ssp2.8839e-02/17sspl.475sp1.475sp2.6750e-02(5.932e-02)N500k2w0.1vm3:070040119 f02 50ssp1.7824e-02>55ssp1.3843e-02(5.532e-02)N500k2w0.1vm3:7NG 040119 f10 50ssp1.7736e-06-9ssp1.3566e-06(1.3728e-04)N500k2w0.1vm3:-1 040119 f11 50ssp2.7047-06.53ssp3.5566e-06(4.3379e-05)N500k2w0.1vm3:-1 040119 f10 50ssp3.7047-0632sp3.5566e-06(4.3379e-05)N500k2w0.1vm3:-1 040112 f07 50ssp4.956e-06-100ssp4.956e-06.40699e-05)N500k2w0.1vm3:-1 040119 f02 50ssp1.465e-06-100ssp4.956e-06-100ssp4.956e-06-100ssp4.956e-06-02-9ssp1.4405e-06.5 N500k2w0.1vm3:-1 040119 f02 50ssp1.465e-02.5 N500k2w0.1vm3:-1 040119 f02 50ssp2.885e-06-9ssp1.4465e-02(5.782e-02)N500k2w0.1vm3:-1 16 (0100s17) f11 100ssp3.8879e-06-32ssp3.553e-06(1.635e-04)N1000k2w0.1vm3:-0 040119 f11 100ssp3.8879e-06-32ssp3.553e-06(4.3379e-05)N500k2w0.1vm3:-0 040120 f07 50ssp5.4152e-06(4.421e-05)N500k2w0.1vm3:-0 040120 f07 50ssp5.4152e-06(4.2421e-05)N500k2w0.1vm3:-0 040120 f07 50ssp5.4152e-06(4.421e-05)N500k2w0.1vm3:-0 040120 f07 50ssp5.4152e-06(4.24e-05)N500k2w0.1vm3:-0 040120 f07 50ssp5.4152e-06(4.24e-05)N500k2w0.1 040119 f03 50ssp1.6149e-06>7ssp1.3624e-06(1.3786e-04)N500k2w0.2vm3:-1 040119 f11 50ssp3.7849e-06>35sp3.869e-06(4.5006e-05)N500k2w0.2vm3:-1 040119 f07 50ssp6.956e-06>45ssp6.259e-06(5.1182e-05)N500k2w0.2vm3:-1 040119 f07 50ssp6.956e-06>45ssp6.259e-06(5.1182e-0.5)N500k2w0.2vm3:-1 040119 f02 50ssp1.878e-02>10ssp1.457e-02(5.835e-02)N500k2w0.2vm3:-1 040119 f02 50ssp1.8600e-02>10ssp1.457e-02(5.835e-02)N500k2w0.2vm3:0 040119 f02 50ssp1.732e-02>7ssp1.457e-02(5.835e-02)N500k2w0.2vm3:0 040119 f02 50ssp1.732e-02>7ssp1.381e-02(5.835e-02)N500k2w0.2vm3:5 040119 f02 50ssp1.6784e-02>10ssp1.457e-02(5.835e-02)N500k2w0.2vm3:5 width=0.1とするとcan2onlineより良い結果が得られ、最終時刻でもまあまあの結果となった。 #execute learning, test and prediction (1)my_plinn.cで 荷重ベクトルの更新式と学習係数を説明しやすいように以下のように変更した。 #i_times # iterations to execute
#d_times #display dat #prediction file #yomin yOmax ylmin ylmax for normalization (1) vがvmin2 以下のユニットは削除。vmin2=-1のとき何もしない。 can2online 5e7 w=0.1 1.7736=06 1.830e-06 6.19287e-06 0.00000041 3.7047e-06 3.855e-06 1.113e-05 0.00000188 8.0602e-06 3.134e-05 1.92884e-05 0.0000529 1.4668e-02 1.665e-02 0.0149962 0.01811174 1.3808e-06 1.830e-06 6.19287e-06 0.00000041 4.4772e-06 3.865e-06 1.113e-05 0.00000188 1.1927e-05 3.134e-05 1.92884e-05 0.00000529 1.2426e-02 1.665e-02 0.0149962 0.0181174 can 2online #init_net
#n_cells #storing vectors
#n_compare #window width #v_thresh vmin vmin2 #0:timeseries,1:chaos width=0.2でもやってみた(f02の結果が不満足) #training file (1)net_save()とnet_load()の整合性をとった。 GlobalTimeをセーブするようにした。 max1e6 max1e6 can2online SVR 5e4 can2online SVR 5e4 5e4 #v_ratio #width #0:online,1:batch vmin2=0としてみた(f02が不満足) 5e5 5e4 5e4 50(*5e4) 5e5 2 0 ./data/lltrain5e4.dat can2batch 5e4 can2batch . 100(*5e4) BestResult

http://terasu.cntl.kyutech.ac.jp/~kuro/sotu/2004/ueno/docs/03ieice_kuro.tex を参照。

荷重ベクトルの更新式を以下のような感じで変えた。

(1-1) my_plinn.cT

for (k=0.7k<(n_channels);k++){
 dwNorm=square (net->cell[1].dw[k]);
 if (dwNorm=fabs(net->cell[1].dw[k]))
 dwNorm=fabs(net->cell[1].dw[k]);

(FLOAT)square(x[j]-net->cell[si].w[j]);

delta_wic = 0.0;
for(j=0; j<n_channels; j++)
delta_wic +=</pre>

delta_wic = (FLOAT)sqrt(delta_wic/2);

(1./GlobalTime-1./GlobalTimeMax); を導入

(1) modify w batch での梅重修正を一括して行うようにした。 (2) ReinitRandom のところを少しかえた。(ReinitRandomはあまり良くない)

(1) modify_w_batchで遠ざける処理を導入。 (2) modify_w_batchでerr_iの正規化処理を導入。

(1)v_iは相対値v_i/v_maxとした→v_threshは0~1の範囲にする。 (2)store_vector_batch(in my_blinn.c)のソート対策が開催ってた。 (3)store_vector_batch(in my_blinn.c)のソートが逆だった。 (4)int_batch ivector (in my_blinn.c) のソートが逆だった。 (5)sigma_batch ivector (in my_bunction.c)をちょっと変えた。 (5)sigma_batch in my_bunction.c)をちょっと変えた。 (6)net->xmin,ymaxを導入→calc_outputを変えた。 (6)net->xmin,xmaxを導入→calc_outputを変えた。 (7)関数定成もできるようにした。

```
